

Employee Software Request Portal ServiceNow Project

Software Installation Request Automation

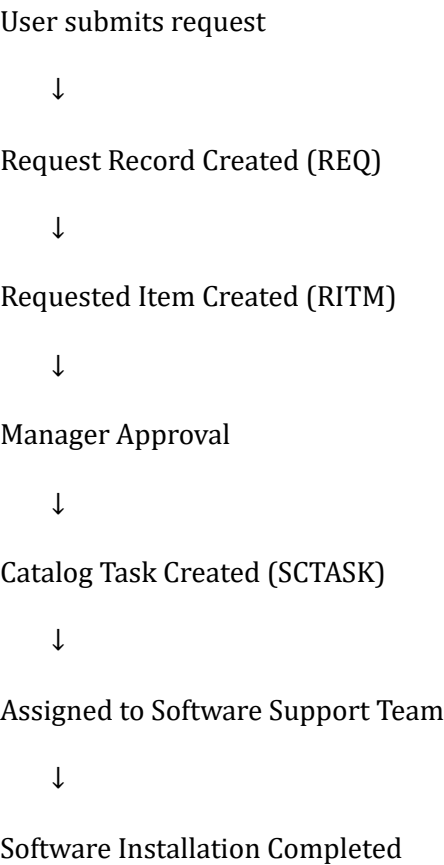

1. Project Overview

The Automated Employee Onboarding and Offboarding System is a digital system that helps organizations manage the process of joining and leaving employees. It automates tasks such as employee registration, document submission, access creation, and asset allocation. It also manages exit processes like revoking access and collecting company assets. The system reduces manual work, saves time, and keeps employee records organized.

2. Business Objective

- 1.To automate the employee onboarding and offboarding process.
- 2.To reduce manual paperwork and human errors.
- 3.To save time for HR and management.
- 4.To maintain organized employee records in one system.
- 5.To ensure secure access management for employees.
- 6.To improve efficiency in HR operations.

3. System Workflow

4. System Architecture

Service Catalog

|

Catalog Item (Software Installation Request)

|

Variables:

- Software Name
- Version Required
- License Justification
- Urgency

|

Flow Designer Workflow

|

└─ Manager Approval

|

└─ Create Catalog Task → Assigned to Software Support Team

5. Data Flow

sc_request → Request (REQ)

↓

sc_req_item → Requested Item (RITM)

↓

sc_task → Catalog Task (SCTASK)

6. Catalog Variables

Software Name – Single Line Text

Version Required – Single Line Text

License Justification – Multi Line Text

Urgency – Choice (Normal, High, Critical)

7. Workflow Automation

Trigger: Request Created

Step 1: Manager Approval

Step 2: Create Catalog Task

Step 3: Assign Task to Software Support Team

8. Field Validation and Automation

Mandatory Fields:

Software Name, Version Required, and License Justification were configured as required fields.

Automatic Population:

Requested For automatically uses the logged-in user.

Department and Location values are pulled from the user profile.

9. Testing and Validation

Test 1: Request (REQ) created successfully

Test 2: Requested Item (RITM) generated

Test 3: Catalog Task (SCTASK) assigned to Software Support Team

Test 4: Submitted variables appear correctly in Requested Item

10. Update Set Deployment

1. Update Set state changed to Complete

2. Exported using Export to XML

3. Imported using Retrieved Update Sets

4. Previewed and committed successfully

11. Screenshots (Add Your Screenshots Here)

- Catalog Item Creation
- Variables Configuration
- Flow Designer Workflow
- Service Catalog Request Form
- Request Record (REQ)
- Requested Item (RITM)
- Catalog Task (SCTASK)
- Update Set Export
- Update Set Commit

12. Final Outcome

The ServiceNow Software Installation Request system successfully automates the request lifecycle:

Submission → Approval → Task Creation → Fulfillment → Completion.

Benefits:

- Automated request processing
- Improved approval tracking
- Efficient task assignment
- Better data management
